Introduction

The **Send Email (SMTP)** tool sends messages to any SMTP compliant mail server. This tool is capable of sending multiple messages in either text or HTML formats, incorporating data from Input and Format steps to any number of recipients. If recordset data being used from an Input step includes a column containing email addresses, then this can be used as a "dynamic" recipient address.

Connections to relevant SMTP servers are made globally, then available for all task steps to use.

The Send Email (SMTP) tool provides an internal address book so that common SMTP addresses can be defined and re-used. MAPI address books, such as those available from Microsoft Mail, Microsoft Outlook, and the Microsoft Exchange Server Global Address List (GAL), are also supported.

Typically, the message content is a document generated by a Format type step, such as **Format as Text**, **Format as HTML**, or **Run Crystal Report**, but it is also possible to attach the document to the message and additionally create fixed or dynamic message content by using columns from a consumed recordset.

Features

- ▶ Supports connections to multiple SMTP servers
- ▶ Native ESMTP client
- ▶ Configurable port selection
- ▶ Supports From, To, Cc and Bcc forms of addressing
- ▶ Static and dynamic reply address for To, Cc and Bcc recipients
- ▶ Supports HTML and text formats
- ▶ Memory features to memorise task data created at run-time
- ▶ Internal address book
- ▶ Support for MAPI address books (requires MAPI)
- ▶ Supports static and dynamic file attachments

Technical Summary

Working with other Tools

The **Send Email (SMTP)** tool can directly interact with the following tools:

Consuming from Other Tools

The **Send Email (SMTP)** tool can consume objects directly outputted by the following tools:

Icon	Tool Name	Tool Category
	Create Workflow Job	Format
	Format as Flat File	Format
	Format as HTML	Format
	Format as HTML Pro	Format
	Format as Text	Format
	Run Crystal Report	Format
	Run Microsoft Reporting Services	Format
	Run Microsoft Word (Merge)	Format

Objects Consumed

The following objects, outputted by the above tools, can be directly consumed by the **Send Email (SMTP)** tool:

- ▶ **Documents (Text)** — Plain text documents
- ▶ **Documents (HTML)** — Standalone HTML pages

Exposing to Other Tools

As an Output category tool, **Send Email (SMTP)** does not expose any objects that can be directly consumed by another tool. However, it does expose the following objects which can be used in a task step sequence:

- ▶ **DocumentSource** — If a **Document Source** has been selected (see [General tab](#)), this contains the data in the document as recordset columns
- ▶ **Step Properties** — Standard step properties are available allowing you to use statistical data of the tool

Prerequisites

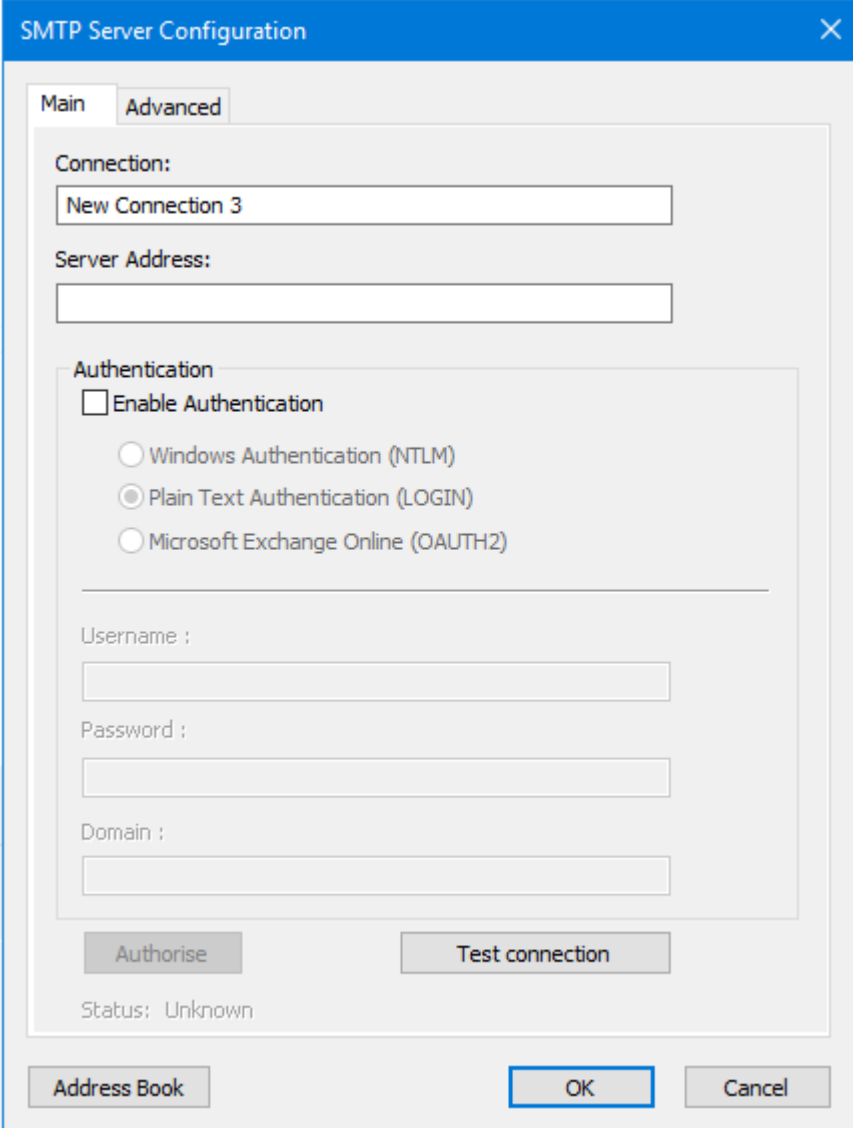

In order for the **Send Email (SMTP)** tool to function correctly, the additional third-party technologies must be in place:

- ▶ SMTP Compliant Mail Server — Compatible with ESMTP client to (RFCs 2821, 1870)

Creating the Connection to an SMTP Server

You must provide the connection details for this SMTP server:

Adding Basic Connection Details

The image shows a 'SMTP Server Configuration' dialog box with a blue title bar and a close button. It has two tabs: 'Main' and 'Advanced'. The 'Main' tab is selected. Inside the dialog, there are several input fields and buttons. The 'Connection:' field contains 'New Connection 3'. The 'Server Address:' field is empty. The 'Authentication' section has a checkbox 'Enable Authentication' which is unchecked. Below it are three radio buttons: 'Windows Authentication (NTLM)', 'Plain Text Authentication (LOGIN)' (which is selected), and 'Microsoft Exchange Online (OAUTH2)'. Below the authentication section are three more input fields: 'Username:', 'Password:', and 'Domain:', all of which are empty. At the bottom of the dialog, there are three buttons: 'Authorise', 'Test connection', and 'OK' (which is highlighted with a blue border). There is also a 'Cancel' button. At the very bottom, there is an 'Address Book' button. The status 'Status: Unknown' is displayed at the bottom left of the main content area.

Enter a unique **Connection** name. If adding connections for different types of SMTP server, it is recommended you add such details to the connection name.

In **Server Address**, add the DNS or IP address of the SMTP server.

If authentication is required by the SMTP server, select **Enable Authentication** and choose between:

- ▶ **Windows Authentication (NTLM)** — The currently logged-in Window's user credentials are used to connect to the SMTP server

- **Plain Text Authentication (LOGIN)** — The specified **Username**, **Password**, and **Domain** (if required) are used to connect to the SMTP server
- **Microsoft Exchange Online (OAuth2)** — If connecting to an Exchange Online / Exchange 365 account, use this authentication type. Enter the required **Username** and click **Authorise**. Enter the account details in the Microsoft Authorisation Console. Should OAuth2 authentication for other email providers be required, contact your Codeless Platforms account manager or partner.

Use **Test connection** to ensure the credentials can be accepted.

Creating a Global Address Book

If required, you can add addresses to a global address book which can be used by any task step using this connection — click **Address Book**:

Name	E-mail Address
Admin	me@bpa.com
Tester	you@bpa.com

NOTE: At the time of writing, the address book is shared by all global connections you create, irrespective of the email server in use.

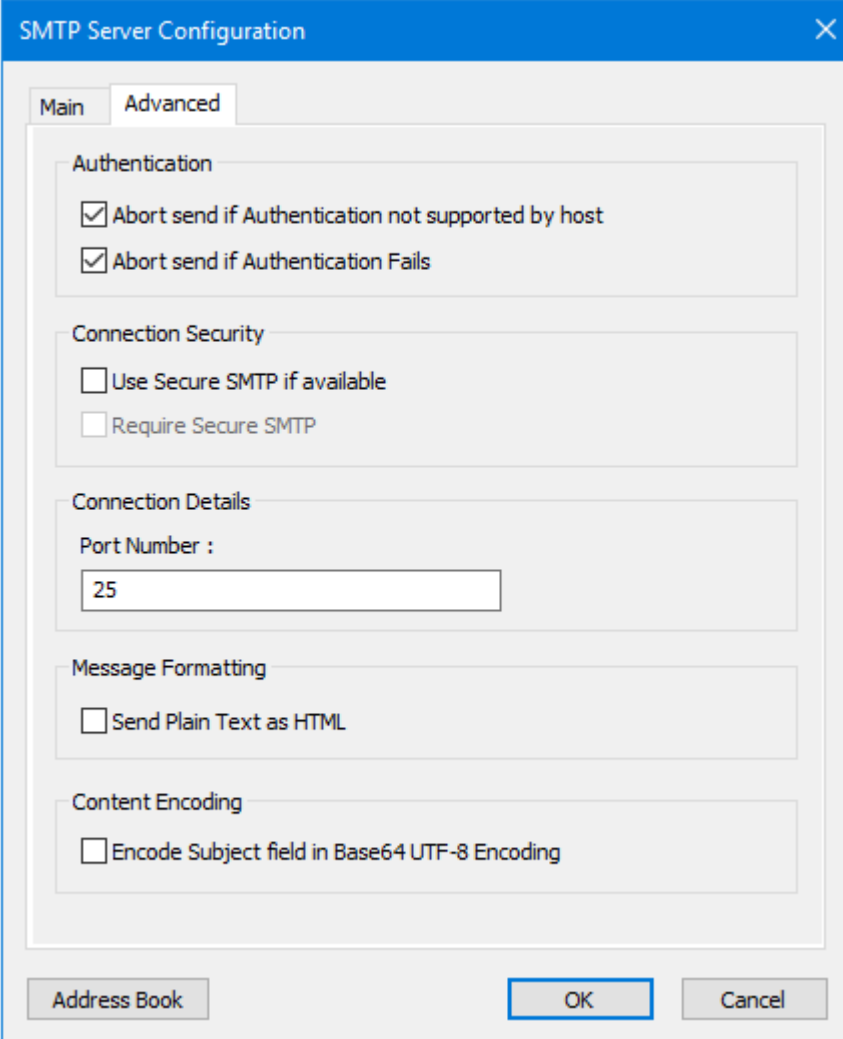

Click **New** to add new addresses. Use **Edit** and **Delete** to manage your existing email addresses.

TIP: Don't forget to add a valid **From** address for the **Send Email (SMTP)** tool to use.

To search for an existing entry, enter the **Name** into **Type Name or Select from List**.

If the address book from the SMTP server is available, select it from the **Show Names from the** drop-down.

Adding Advanced Connection Details

The image shows the 'SMTP Server Configuration' dialog box with the 'Advanced' tab selected. The dialog has a blue title bar with a close button. Inside, there are two tabs: 'Main' and 'Advanced'. The 'Advanced' tab contains several sections: 'Authentication' with two checked checkboxes ('Abort send if Authentication not supported by host' and 'Abort send if Authentication Fails'), 'Connection Security' with two unchecked checkboxes ('Use Secure SMTP if available' and 'Require Secure SMTP'), 'Connection Details' with a 'Port Number' field set to '25', 'Message Formatting' with an unchecked checkbox ('Send Plain Text as HTML'), and 'Content Encoding' with an unchecked checkbox ('Encode Subject field in Base64 UTF-8 Encoding'). At the bottom, there are three buttons: 'Address Book', 'OK', and 'Cancel'.

If **Authentication** has been enabled in the [Main tab](#), you can choose to:

- ▶ **Abort send if Authentication not supported by host** — Emails sent by task steps using this connection are aborted if the chosen authentication method is not accepted by the SMTP server
- ▶ **Abort send if Authentication fails** — Emails sent by task steps using this connection are aborted if the supplied credentials, whether from the logged-in user or taken from the **Authentication** pane, are incorrect

Adding Secure Connection Details

If secure SMTP (SMTPS) is supported by the SMTP server, you can choose to:

- ▶ **Use Secure SMTP if available** — If SMTPS is not supported by the server then plain text is used instead (if allowed by the server).
- ▶ **Require Secure SMTP** — If SMTPS is in use, this option makes it compulsory for all emails sent. If TLS is not available, then an event is written to the Event Log instead of the email being sent.

By default, the **Send Email (SMTP)** tool uses **Port Number 25** to communicate with the SMTP server. Amend this here as required by your SMTP server.

Changing the Message Formatting

By default, plain text emails are sent as plain text and HTML emails as HTML. If the SMTP server only accepts HTML emails, enable **Send Plain Text as HTML** to convert all plain text emails before sending.

Encoding the Subject Line

You can choose whether to **Encode Subject field in Base64 UTF-8 Encoding**. This is particularly useful if you are using a variable, recordset column, or step property to create a dynamic email subject at task run-time — if the Subject's dynamic content contains non-Latin characters, without this parameter enabled, this will render as question marks (?).

Step Configuration

To add a new **Send Email (SMTP)** step to an existing task, you either:

- ▶ Click and drag the **Send Email (SMTP)** icon from the **Task Browser** to the task **Design** area.
- ▶ From the task's **Design** tab, right-click on empty space and select **New > Output > Send Email (SMTP)**.

For a detailed description of how to create new tasks, refer to the product help.

About the General Tab

The screenshot shows a Windows-style dialog box titled "Send Email (SMTP)". It has four tabs: "General", "Connection", "Main", and "Options". The "General" tab is selected. Inside the "General" tab, there is a "Name" field with the text "Send Email (SMTP)". Below it is a "Description" field, which is a large empty text area. At the bottom of the "General" tab, there is a checkbox labeled "Read documents from a source" which is checked. Below the checkbox is a "Document Source" dropdown menu showing "Documents from Format as Flat File [text]". At the bottom right of the dialog box are "OK" and "Cancel" buttons.

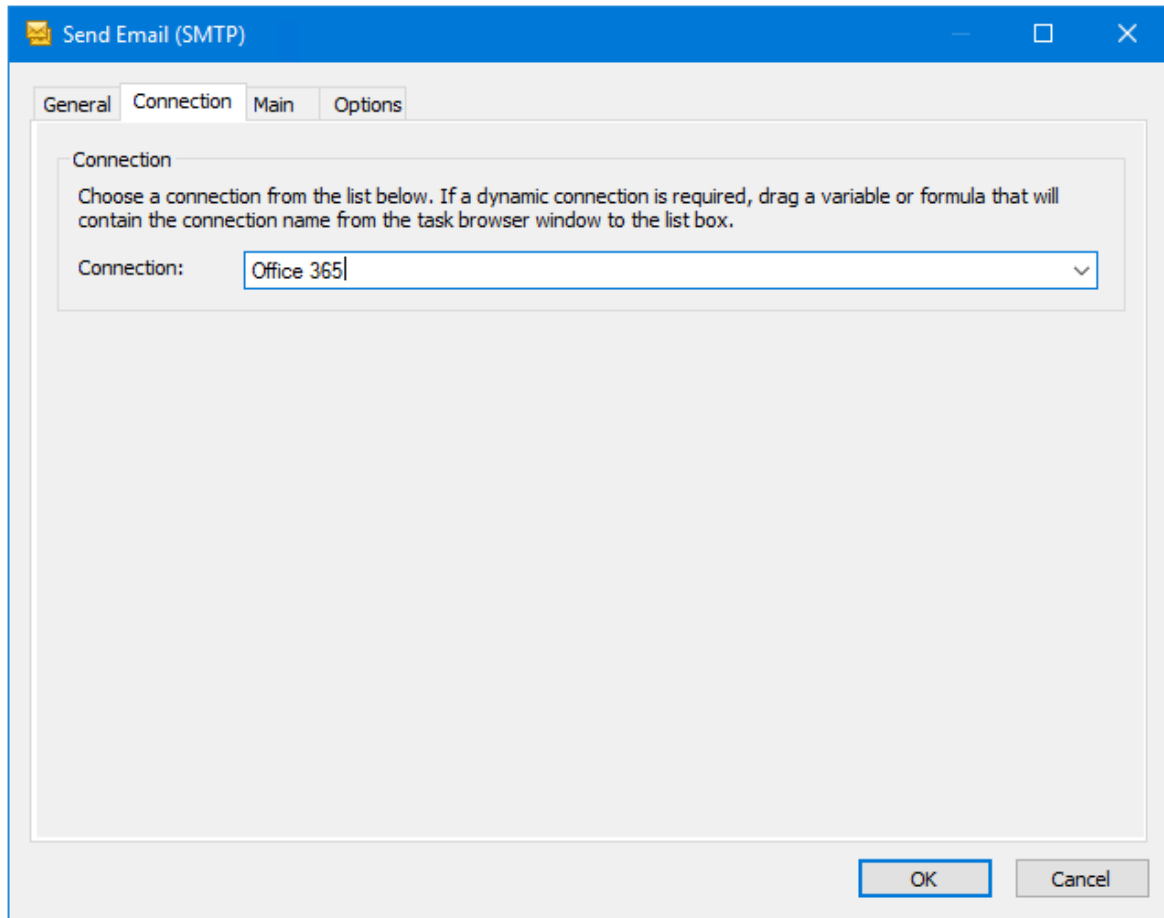

The **General** tab is used to **Name** and describe (**Description**) this task step.

TIP: If this task instance makes use of two or more **Send Email (SMTP)** steps, ensure the **Name** used is unique for each individual step.

- ▶ **Read documents from a source** — Enable this parameter if document data from a Format task step is required when creating the email
 - **Document Source** — Contains all available documents from Format steps previously created in the task; note that the document format is displayed after the step name.

About the Connection Tab

You specify the SMTP server **Connection** this step must use.

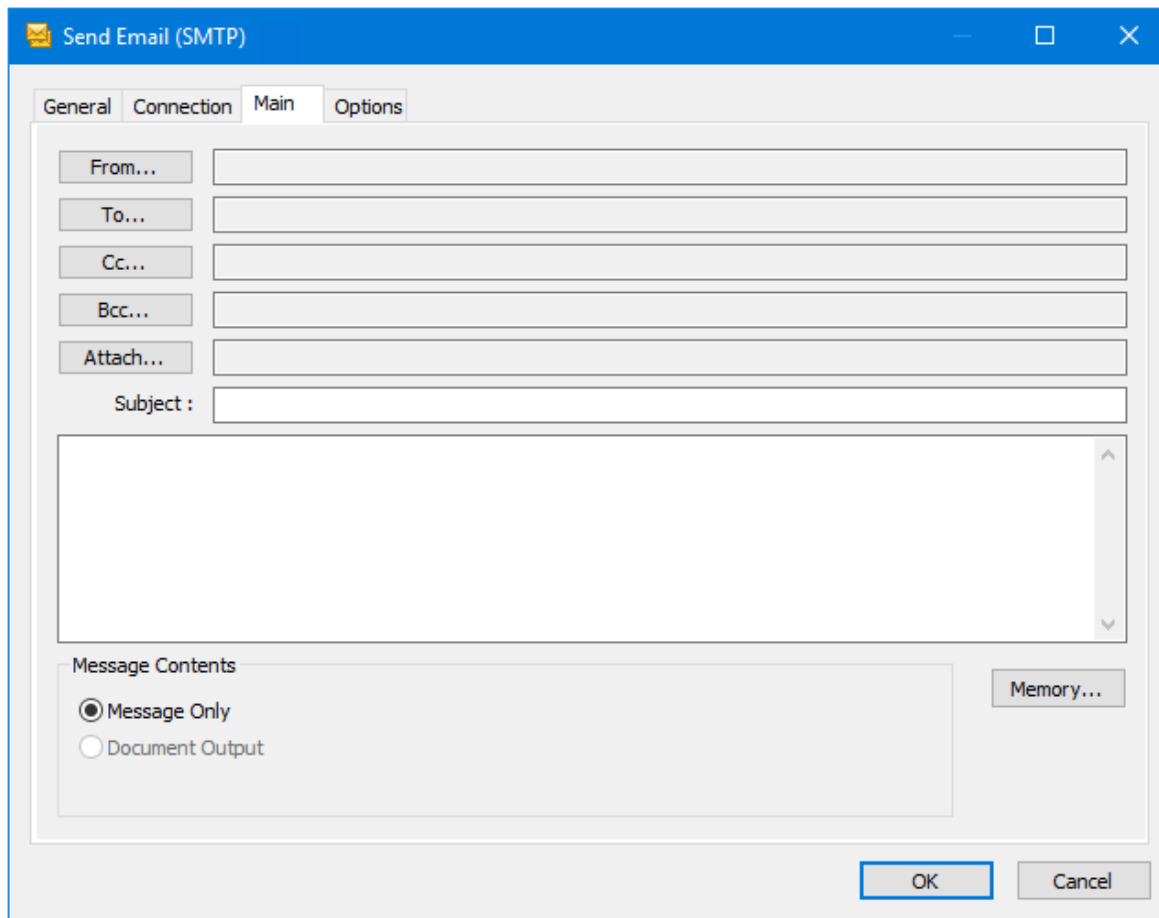

All connections created in the [global configuration](#) are presented here.

Alternatively, you can use a BPA Platform variable or formula to create a dynamic connection, where the connection used is determined by runtime circumstances. At runtime, the contents of the variable must match the name of one of the global connections — this is case-sensitive.

About the Main Tab

Use the **Main** tab to configure the email content and recipients.

The screenshot shows the 'Send Email (SMTP)' dialog box with the 'Main' tab selected. The dialog has a blue title bar with a yellow envelope icon and the text 'Send Email (SMTP)'. Below the title bar are four tabs: 'General', 'Connection', 'Main', and 'Options'. The 'Main' tab is active. It contains several input fields: 'From...', 'To...', 'Cc...', 'Bcc...', 'Attach...', and 'Subject :'. Below these is a large text area for the email body. At the bottom left, there is a 'Message Contents' section with two radio buttons: 'Message Only' (selected) and 'Document Output'. To the right of this section is a 'Memory...' button. At the bottom right of the dialog are 'OK' and 'Cancel' buttons.

Use **Memory** to memorise some or all of the step output for use in other task steps. This is particularly useful when the **Send Email (SMTP)** step is called multiple times — use **Memory** to compare the email previously processed to the new email currently being processed to avoid duplicates.

Adding the From Address

Click **From** to add the email address:

Name	E-mail Address
Admin	me@bpa.com
Tester	you@bpa.com

☐ One off / Dynamic Address

Display Name:
Admin

Address:
me@bpa.com

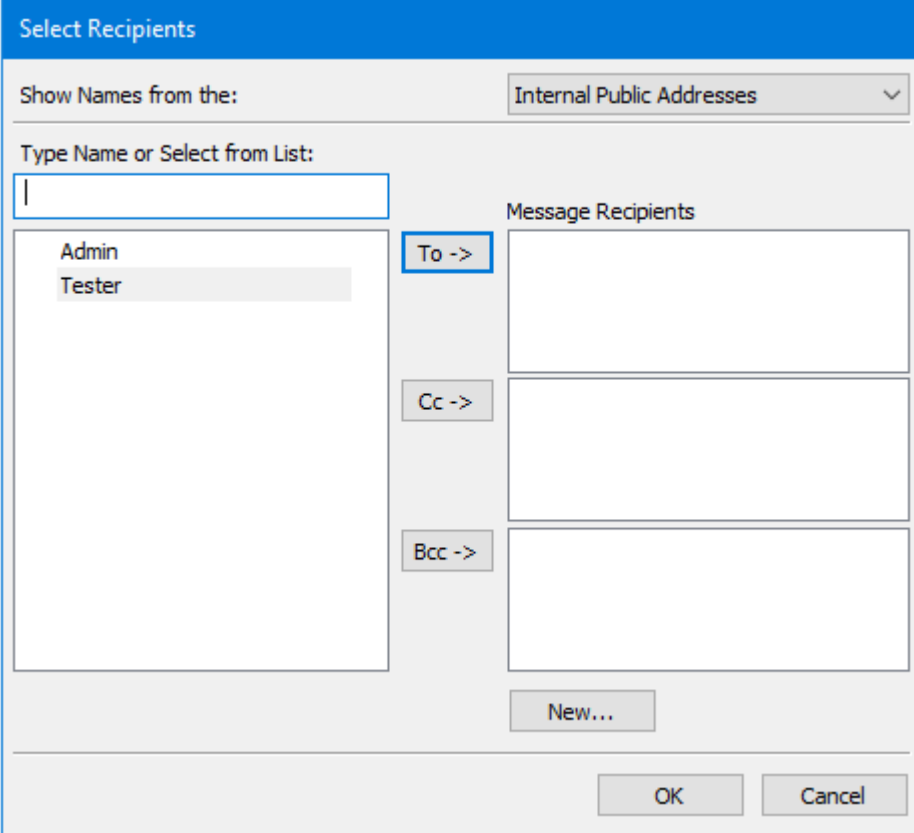

OK Cancel

Use **Type Name or Select from List** to search for the relevant email address. If the address book from the SMTP server is available, select it from the **Show Names from the** drop-down to use an address from there.

If the **From** address is not available in the email list, you can add a **One off / Dynamic Address**. Enable this parameter and add the **Display Name** and email **Address**. Data source variables, recordset columns, or step properties can be dragged-and-dropped to either field to create a dynamic name or email address.

Adding Email Recipients

Click either **To**, **Cc**, or **Bcc** to add email recipients:

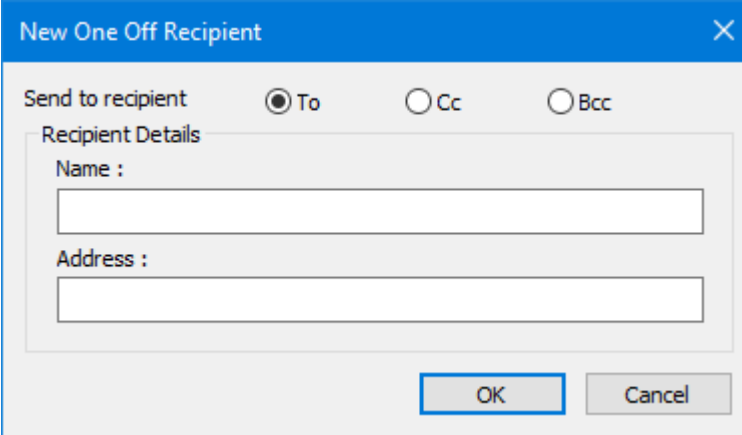

The **Select Recipients** dialog box features a blue header bar. Below it, a dropdown menu labeled "Show Names from the:" is set to "Internal Public Addresses". A text input field labeled "Type Name or Select from List:" is positioned above a list box containing "Admin" and "Tester", with "Tester" highlighted. To the right of the list box are three buttons: "To ->", "Cc ->", and "Bcc ->". Further right, under the heading "Message Recipients", are three empty text boxes corresponding to the "To", "Cc", and "Bcc" fields. A "New..." button is located below the "Bcc ->" button. At the bottom right are "OK" and "Cancel" buttons.

Preconfigured email addresses are shown on the left. Use **Type Name or Select from List** to search for the relevant email address. If the address book from the SMTP server is available, select it from the **Show Names from the** drop-down to use an address from there.

Highlight the relevant address and click **To**, **Cc**, or **Bcc** as required.

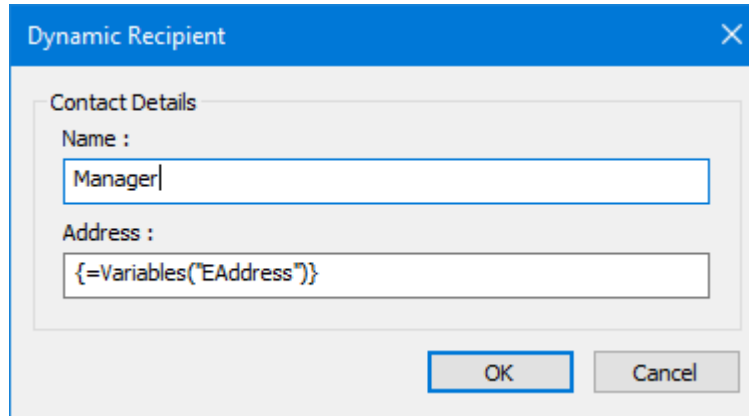

If the required address is not available in the email list, you can add a one off recipient. Click **New** and add the **Name** and email **Address**. Data source variables, recordset columns, or step properties can be dragged-and-dropped to either field to create a dynamic name or email address.

The **New One Off Recipient** dialog box has a blue header bar with a close button (X). It contains three radio buttons under "Send to recipient": "To" (selected), "Cc", and "Bcc". Below these is a section titled "Recipient Details" with two text input fields: "Name :" and "Address :". At the bottom right are "OK" and "Cancel" buttons.

Alternative Method of Adding Dynamic Recipients

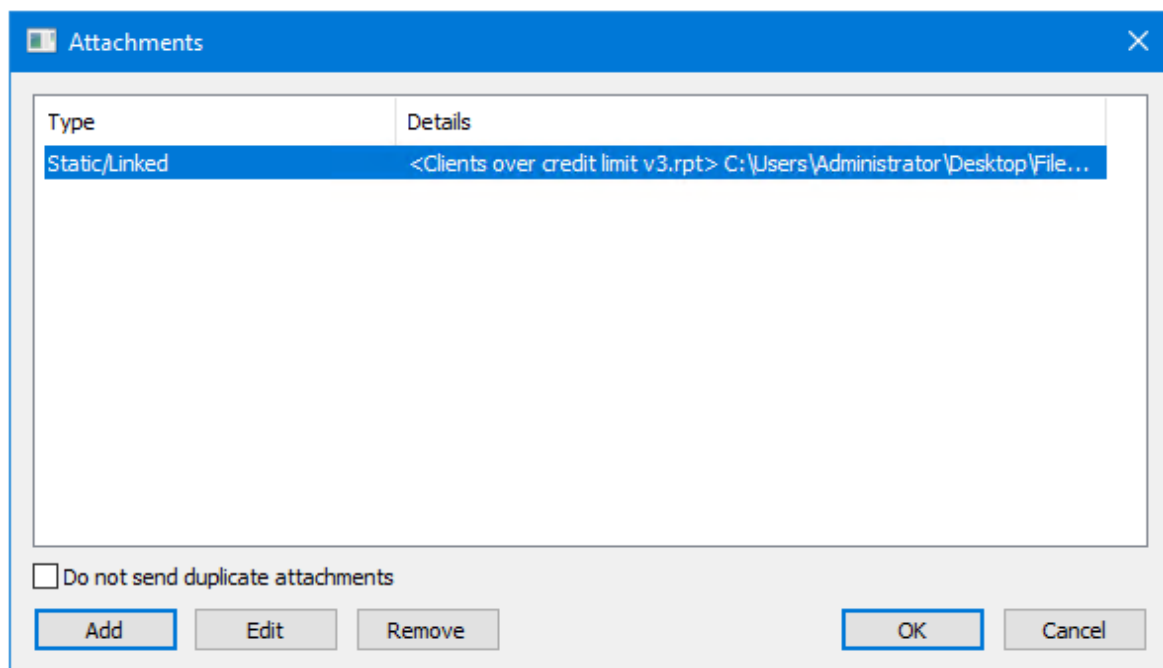

You can also add dynamic recipients by dragging-and-dropping data source variables, recordset columns, or step properties from the Task Browser to the relevant **Message Recipients** text box in the **Select Recipient** interface. This renders the name and address with the same dynamic value. To change this, either double-click the new recipient or right-click on it and select **Properties**, and adjust the **Name** or **Address** as required:

The **Dynamic Recipient** dialog box has a blue title bar with a close button. It contains a **Contact Details** section with two text boxes. The **Name :** box contains the text "Manager". The **Address :** box contains the dynamic expression "{=Variables("EAddress")}". At the bottom right are **OK** and **Cancel** buttons.

Adding Email Attachments

To add file attachments to the email, click **Attach**:

The **Attachments** dialog box has a blue title bar with a close button. It features a table with two columns: **Type** and **Details**. The first row has "Static/Linked" in the **Type** column and "<Clients over credit limit v3.rpt> C:\Users\Administrator\Desktop\File..." in the **Details** column. Below the table is a checkbox labeled "Do not send duplicate attachments". At the bottom are **Add**, **Edit**, **Remove**, **OK**, and **Cancel** buttons.

Type	Details
Static/Linked	<Clients over credit limit v3.rpt> C:\Users\Administrator\Desktop\File...

To prevent duplicate attachments (those with the same filename) being sent during the same task run, enable **Do not send duplicate attachments**.

Click **Add** to add new attachments — note that files added here are not available to other **Send Email (SMTP)** task steps; they are for use with this step instance only. Use **Edit** and **Remove** to managed existing attachments.

Adding a Static Attachment

Static attachments are physical, existing files that do not change at task run-time — enable **Static Attachment**.

Edit Attachment

Attachment Options

☒ Static Attachment ☐ Dynamic Attachment

☐ Import File
☒ Link to File on Disk

Filename: Browse...

Attachment Name:

Last Modified -

Last Updated -

Status: -

Update

OK Cancel

Use **Import File** to import the file into the **Send Email (SMTP)** task step. A copy of the file is cached into the task step so if the file is amended in any way, those changes are not reflected in the emails sent until **Update** is clicked. Click **Browse** to locate and import the file.

Use **Link to File on Disk** to create a reference to the file. This is the recommended option to use as the latest version of the file is "picked up" during every task run and sent to the recipient. Click **Browse** to locate the file and create the reference.

In both cases, if required, you can rename the file to have a different filename when being sent from this task step — enter the new name into **Attachment Name**.

File properties are displayed underneath.

The **Options** tab allows you to decide what happens if the file cannot be found:

The screenshot shows the 'Edit Attachment' dialog box with the 'Options' tab selected. The dialog has a blue title bar with the text 'Edit Attachment' and a close button. Inside, there are two tabs: 'Attachment' and 'Options'. The 'Options' tab is active and contains two main sections: 'Dynamic Attachment Options' and 'Error Handling'. The 'Dynamic Attachment Options' section has the text 'Add these attachment(s):' followed by three radio buttons: 'Once to Each Mail' (selected), 'Each Time Column Changes:', and 'For Each Row'. To the right of the 'Each Time Column Changes:' radio button is a dropdown menu showing 'EventID'. The 'Error Handling' section has the text 'If file is not found:' followed by three radio buttons: 'Send Message Regardless' (selected), 'Send Message But Log Warning', and 'Do Not Send Message and Log Error'. At the bottom right of the dialog are 'OK' and 'Cancel' buttons.

- ▶ **Send Message Regardless** — The message is sent without the attachment
- ▶ **Send Message But Log Warning** — The message is sent without the attachment and a warning is logged to the Event Log for the task
- ▶ **Do Not Send Message and Log Error** — No message is sent and an error is logged to the Event Log for the task

Adding a Dynamic Attachment

Dynamic attachments change for every task run — enable **Dynamic Attachment**.

The screenshot shows the 'Edit Attachment' dialog box with the 'Attachment' tab selected. The 'Dynamic Attachment' radio button is chosen. Under this option, 'Path To File On Disk' is selected, showing a text field for 'Path' and a 'Browse...' button. The other options, 'File From Data' and 'File From Document', are also visible with their respective text fields. The 'OK' and 'Cancel' buttons are at the bottom right.

Path to File On Disk works in the same way as **Link to File on Disk** for static attachments, but you cannot give the file a new name when sending. Click **Browse** to locate the file and create the reference, or use variables or recordset columns to create a dynamic file path and name.

If you have a file stored in a database table which you want to use as the attachment, enable **File from Data** — for example, images and PDFs. Use a **Database Query** step to extract the file to a recordset. Drag the recordset column containing the file to **Source**. Either manually create a static **Name** for the attachment, or use variables, recordset columns, or step properties to create a dynamic name.

If a document from a previous task step is being consumed (see [General tab](#)), you can use that as the dynamic attachment — enable **File From Document**. Either manually create a static **Name** for the attachment, or use variables, formulas, recordset columns, or step properties to create a dynamic name.

The **Options** tab allows you to decide how to handle the attachment:

The screenshot shows the 'Edit Attachment' dialog box with the 'Options' tab selected. The dialog has a blue title bar with the text 'Edit Attachment' and a close button. Inside, there are two tabs: 'Attachment' and 'Options'. The 'Options' tab contains two sections: 'Dynamic Attachment Options' and 'Error Handling'. In the 'Dynamic Attachment Options' section, there is a label 'Add these attachment(s):' followed by three radio buttons: 'Once to Each Mail' (selected), 'Each Time Column Changes:', and 'For Each Row'. To the right of the 'Each Time Column Changes:' radio button is a dropdown menu showing 'EventID'. In the 'Error Handling' section, there is a label 'If file is not found:' followed by three radio buttons: 'Send Message Regardless' (selected), 'Send Message But Log Warning', and 'Do Not Send Message and Log Error'. At the bottom right of the dialog are 'OK' and 'Cancel' buttons.

- ▶ **Once to Each Mail** — The attachment is added once to each email generated by the task
- ▶ **Each Time Column Changes** — A new attachment is created when the value of the selected field changes
- ▶ **For Each Row** — A new attachment is created for each new row in the recordset returned by the data source query

Adding an Email Subject

Either manually create a static **Subject** for the email, or use variables, recordset columns, or step properties to create a dynamic subject. If the dynamic content uses non-Latin characters, ensure you enable to **Encode Subject field in Base64 UTF-8 Encoding** in the [global configuration](#). Without this parameter enabled, non-Latin characters render as question marks (?).

Defining the Email Message

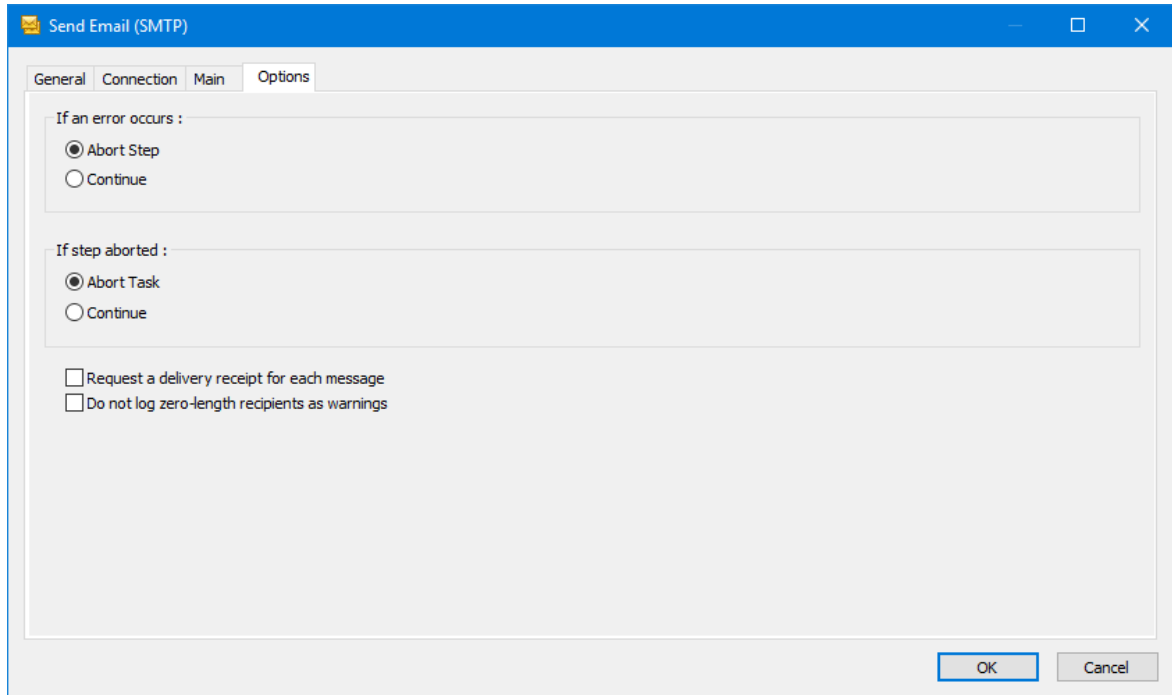

You can choose whether the email body consists of:

- ▶ **Message Only** — Enable this option to create the email body in the space provided. Variables, recordset columns, and step properties can be dragged in to create dynamic data. If a document from a previous task step is being consumed, this can be used as an attachment.

- **Document Output** — If a document from a previous task step is being consumed, enable this option to use the consumed document as the email body. Note that this does not allow you to add extra text to the email body, however separate files can be added as attachments.

About the Options Tab

The **Options** tab allows you to define how errors in this step are handled at task runtime.

If an error occurs, you can decide whether the step should **Continue** processing, or terminate the step immediately (**Abort Step**).

If the step is aborted, you can choose to **Continue** processing onto the next step in the task, or terminate the whole task immediately (**Abort Task**).

You can **Request a delivery receipt for each message** sent, however this is dependant on the recipient's mailbox settings as to whether a receipt is sent.

By default warnings are logged in the Event Log for any emails where the CC or BCC fields contain NULL or blank values passed in at runtime. Selection of the **Do not log zero-length recipients as warnings** option will prevent these warnings being logged.
